

Test Plan: Restful-Booker-Platform

Bed & Breakfast Booking System — QA Practice Project

Prepared by: Sofiyanatul Munawaroh (Sofi)

Role: Software Quality Assurance (Portfolio Project)

Application Under Test: <https://automationintesting.online/>

Document Version: 1.0

1. Objective

To verify that the core features of Restful-Booker-Platform — a bed & breakfast booking system, analogous to a hotel or hospital booking system — function as expected, from both the front-end user and admin panel perspective. This project was built as a QA skills demonstration (manual testing methodology) using a public sandbox application designed for testing practice, not a production client system.

2. Scope

In scope: Room browsing, booking flow (date selection, guest data validation), contact form, admin login, admin room management, admin booking management, and responsiveness.

Out of scope: Backend/database internals, payment gateway (not implemented in this demo), load/performance testing, and security penetration testing.

3. Test Approach / Strategy

A combination of manual and exploratory testing was used. Test cases were written using a structured format (ID, Precondition, Steps, Expected Result, Actual Result, Status) consistent with professional QA practice. Techniques applied include equivalence partitioning, boundary value analysis, and negative testing, supplemented by charter-based exploratory sessions to probe date logic, input validation, access control, and UI consistency.

4. Test Environment

Item	Detail
Application URL	https://automationintesting.online/
Browser	Chrome (primary), cross-checked on other browsers
Test Case Management	Structured spreadsheet (Test Case ID, Steps, Expected/Actual Result)
Bug Tracking	Structured bug report format (Severity, Priority, Steps to Reproduce, Evidence)
Device	Desktop (1920x1080), mobile viewport (375x667)

5. Entry & Exit Criteria

Entry: Application is publicly accessible and stable; test cases drafted and self-reviewed.

Exit: All planned test cases executed; all identified defects documented with full reproduction steps and evidence; critical-path automation (where applicable) passes at least one full run.

6. Deliverables

Test Plan (this document) · Test Case Sheet (31 cases) · Bug Reports for each defect found · Test summary for portfolio case study.

7. Risks & Assumptions

The application is a public sandbox and may reset data periodically; findings were documented with screenshots to preserve evidence. No sensitive or confidential data is involved, as the application is explicitly designed for public testing practice.
