

Test Plan: ParaBank Online Banking

Public Banking Demo Application — QA Practice Project

Prepared by: Sofiyanatul Munawaroh (Sofi)

Role: Software Quality Assurance (Portfolio Project)

Application Under Test: <https://parabank.parasoft.com/parabank/index.htm>

Document Version: 1.0

1. Objective

To verify that the core features of ParaBank — Parasoft's official public online-banking demo application — function as expected, particularly business logic involving financial transactions (fund transfers, balances, bill payments). This project was built as a QA skills demonstration using a public sandbox application intended for testing practice, deliberately chosen in a different domain (banking) from a prior booking-system project to broaden coverage of business-logic testing.

2. Scope

In scope: Registration, Login, Account Overview, Open New Account, Transfer Funds, Bill Pay, Account Activity/Find Transactions, Update Contact Info, Request Loan.

Out of scope: SOAP/REST web services (API-level testing), the Admin Page's database Initialize/Clear controls (touching these could reset shared data for all users of the public sandbox), load/performance testing, and third-party payment gateways (not present in this application).

3. Test Approach / Strategy

A combination of manual and exploratory testing, with particular focus on financial business-logic validation: whether balances are calculated correctly after transfers, whether the system prevents transfers exceeding available balance, and whether account data remains consistent across pages. Test cases follow a consistent structure: ID, Precondition, Steps, Expected Result, Actual Result, Status.

Techniques: Equivalence partitioning and boundary value analysis (transfer amounts: zero, negative, exceeding balance, same-account); negative testing (invalid input, empty fields, mismatched verification fields); exploratory testing (balance consistency across pages, financial-form UX).

4. Test Environment

Item	Detail
Application URL	https://parabank.parasoft.com/parabank/index.htm
Browser	Chrome (primary), Firefox (cross-browser check)
Test Case Management	Structured spreadsheet (Test Case ID, Steps, Expected/Actual Result)
Bug Tracking	Structured bug report format (Severity, Priority, Steps to Reproduce, Evidence)
Device	Desktop (1920x1080)

5. Entry & Exit Criteria

Entry: Application is publicly accessible and stable; test cases drafted and self-reviewed.

Exit: All planned test cases executed; all identified defects documented with full reproduction steps and evidence.

6. Deliverables

Test Plan (this document) · Test Case Sheet (30 cases) · Bug Reports for each defect found · Test summary for portfolio case study.

7. Risks & Assumptions

The application is a public sandbox and its data may be shared/reset; findings were documented with screenshots to preserve evidence, and a self-registered account was used to control test preconditions. No real financial data is involved — account numbers and balances are simulated, and the application explicitly states it is not a real bank.
